# Use of enamine derivatives as ultraviolet-A filters - are more stable than current UV-A filters

Patent Number: EP-852137

International patents classification : A61K-00° 42 C0°C-05° 00 C0°C-255 04 C0°C-409 22 A61K-00° 00 A61K-00° 00 A61K-00° 40 A61K-00° 48 A61K-031 13 A61K-031 255 A61K-031 255 A61K-031 255 A61K-031 255 A61K-031 255 A61K-031 255 A61K-031 256 C0°C-022 00 C0°C-021 49 C0°C-21° 54

EP-852137 A Use of enamine derivatives of formula (R3)(R4NH)C C(R1)(R2) (I) as UV filters in cosmetic and pharmaceutical preparations for protection of hair or skin against sun-radiation, alone or in combination with UV absorbers is new: R1 = COOR5, COR5, CONR5R6, CN, SO2R5, SO2OR5 or P(=OX)R7OR8; R2 = COX)R6, COR6, CONR5R6, CN, SO2R6, SO2OR6 or P(=OX)R7OR8; R3 - H, or optionally substituted aliphatic, cycloaliphatic, arylaliphatic or aromatic residue with up to 18C; R4 = optionally substituted 5-12C aromatic or heteroaromatic residue; and R5, R6 = H or aliphatic, cycloaliphatic, or optionally substituted aromatic with up to 18C; or R3-R8 together with their bonded carbon atoms may form a 5-6 membered ring which may be further annelated.

USE - (I) are useful as UV-A filters (claimed).

ADVANTAGE - (I) show greater photostability than usual UV-A filters. (Dwg.0'0)

- (A) Photostabile UV-Filter enthaltende kosmetische und pharmazeutische Zubereitungen
- Verwendung von Verbindungen der Formel I

in der die C=C Doppelbindung in der E oder Z Konfiguration vorliegt und die Variablen folgende Bedeutung ha-

ben: R<sup>1</sup> COOR<sup>5</sup>, COR<sup>5</sup>, CONR<sup>5</sup>R<sup>6</sup>, CN, O=S(-R<sup>5</sup>)=O, O=S(-OR<sup>5</sup>)= O, R<sup>7</sup>O-P(-OR<sup>8</sup>)=O; R<sup>2</sup> COOR<sup>6</sup>, COR<sup>6</sup>, CONR<sup>5</sup>R<sup>6</sup>, CN, O=S(-R<sup>6</sup>)=O, O=S(-OR<sup>6</sup>)=

O, R<sup>7</sup>O-P(-OR<sup>8</sup>)=O; R<sup>3</sup> Wasserstoff, einen gegebenenfalls substituierten aliphatischen, cycloaliphatischen, araliphatischen oder aro-

matischen Rest mit jeweils bis zu 18 C-Atomen; R<sup>4</sup> einen gegebenenfalls substituierten aron einen gegebenenfalls substituierten aromatischen oder heteroaromatischen Rest mit 5 bis 12 Ringatomen;

R<sup>8</sup> unabhängig voneinander Wasserstoff, einen offenkettigen oder verzweigten aliphatischen, araliphatischen, cycloaliphatischen oder gegebenenfalls substituierten aro-

matischen Rest mit jeweils bis zu 18 C-Atomen, wobei die Variablen R<sup>3</sup> bis R<sup>8</sup> untereinander, jeweils zusammen mit den Kohlenstoffatomen, an die sie gebunden sind, gemeinsam einen 5- bis 6-Ring bilden können, der gegebenenfalls weiter anelliert sein kann, als UV-Filter in kosmetischen und pharmazeutischen Zubereitungen zum Schutz der menschlichen Haut oder menschlicher Haare gegen Sonnenstrahlen, allein oder zusammen mit an sich für kosmetische und pharmazeutische Zubereitungen bekannten, im UV-Bereich absorbierenden Ver-

sche oder gegebenenfalls substituierte, aromatische Reste mit bis zu 8 C-Atomen bedeuten.

Besonders bevorzugt ist die Verwendung von Verbindungen der Formel I, in der R³ für Wasserstoff, R¹ für CN, COOR⁵ und COR⁵ und COR⁵ und COR⁵ und R² für CN, COOR⁵ und COR⁵ stehen, wobei R⁵ und R⁶ voneinander unabhängig offenkettige oder verzweigte aliphatische oder gegebenenfalls substituierte, aromatische Reste mit bis zu 8 C-Atomen bedeuten und R⁴ für einen gegebenenfalls substituierten aromatischen oder heteroaromatischen Rest mit bis zu 10 C-Atomen im Ring, insbesondere einen substituierten Phenyl-, Thienyl-, Furyl-, Pyridyl-, Indolyl- oder Naphthylenrest und besonders bevorzugt für einen gegebenenfalls substituierten Phenyl- oder Thienylrest steht.

Als Substituenten kommen sowohl lipophile als auch hydrophile Substituenten mit z. B. bis zu 20 C-Atomen in Betracht. Lipophile d. h. die Öllöslichkeit der Verbindungen der Formel I verstärkende Reste sind z. B. aliphatische oder cycloaliphatische Reste insbesondere Alkylreste mit 1 bis 18 C-Atomen, Alkoxy-, Mono- und Dialkylamino-, Alkoxycarbonyl-, Mono- und Dialkylaminocarbonyl-, Mono- und Dialkylaminocarbonyl-, Mono- und Dialkylaminosulfonylreste, ferner Cyan-, Nitro-, Brom-, Chlor-, Iod- oder Fluorsubstituenten.

Hydrophile d. h. die Wasserlöslichkeit der Verbindungen der Formel I ermöglichende Reste sind z. B. Carboxy- und Sulfoxyreste und insbesondere deren Salze mit beliebigen physiologisch verträglichen Kationen, wie die Alkalisalze oder wie die Trialkylammoniumsalze, wie Tri-(hydroxyalkyl)-ammoniumsalze oder die 2-Methylpropan-1-ol-2-ammoniumsalze. Ferner kommen Alkylammoniumreste mit beliebigen physiologisch verträglichen Anionen in Betracht.

Als Alkoxyreste kommen solche mit 1 bis 12 C-Atomen, vorzugsweise mit 1 bis 8 C-Atomen in Betracht.

Beispielsweise sind zu nennen:

methoxy n-propoxy-

n-butoxy-

2-methylpropoxy-1,1-dimethylpropoxy-

hexoxy-

heptoxy-

2-ethylhexoxy-

isopropoxy-

1-methylpropoxy-

n-pentoxy-

3-methylbutoxy-

2,2-dimethylpropoxy-

1-methyl-1-ethylpropoxy-

octoxy-

Als Mono- oder Dialkylaminoreste kommen z. B. solche in Betracht, die Alkylreste mit 1 bis 8 C-Atomen enthalten, wie Methyl-, n-Propyl-, n-Butyl-, 2-Methylpropyl-, 1,1-Dimethylpropyl-, Hexyl-, Heptyl-, 2-Ethylhexyl-, Isopropyl-, 1-Methylpropyl-, n-Pentyl-, 3-Methylbutyl-, 2,2-Dimethylpropyl-, 1-Methyl-1-ethylpropyl- und Octyl in Betracht. Diese Reste sind gleichermaßen in den Mono- und Dialkylaminocarbonyl- und Sulfonylresten enthalten.

Alkoxycarbonylreste sind z. B. Ester, die die oben genannten Alkoxyreste oder Reste von höheren Alkoholen z. B. mit bis zu 20 C-Atomen, wie iso-C<sub>15</sub>-Alkohol, enthalten.

Die Erfindung betrifft auch die neuen Verbindungen der Formel II

$$R^4$$
  $NH$   $C$   $CC$   $CH_3$   $C$ 

in der die C=C Doppelbindung in der E oder Z Konfiguration vorliegt und in der R<sup>4</sup> einen Phenylrest bedeutet, der gegebenenfalls durch einen oder mehrere Alkyl-, Alkoxy-, Alkylaminocarbonyl-, Alkoxycarbonyl-, mit jeweils bis zu 20 C-Atomen oder Cyan- oder Carboxyreste oder durch wasserlöslich machende Reste ausgewählt aus der Gruppe bestehend aus Carboxylat-, Sulfonat- oder Alkylammoniumresten substituiert ist. Solche Reste sind z. B. Alkalicarboxylat oder Carbonyloxy-tri-(hydroxyethyl)ammonium- oder Sulfonyloxy-tri-(hydroxyethyl)ammoniumreste.

Weiterhin betrifft die Erfindung die neuen Verbindungen der Formel III,

in der die C=C Doppelbindung in der E oder Z Konfiguration vorliegt und in der R<sup>4</sup> einen Phenylrest bedeutet, der gegebenenfalls durch einen oder mehrere Alkoxyreste mit bis zu 20 C-Atomen oder Alkoxycarbonylreste mit 4 bis zu 20 C-Atomen, sowie durch wasserlöslich machende Substituenten, ausgewählt aus der Gruppe bestehend aus Carboxylat, Sulfonat- oder Alkylammoniumresten, substituiert ist und R<sup>5</sup> eine offenkettige, verzweigte oder cyclische Alkyl-, Alkoxy- oder Alkoxyalkylgruppe mit jeweils bis zu 18 C-Atomen oder eine Aryloxygruppe bedeutet.

Beispielhaft sind in der folgenden Tabelle 1 die bevorzugten erfindungsgemäßen Verbindungen der Formel III ge-

Die erfindungsgemäß zu verwendenden Verbindungen der Formel I bis III können nach der Gleichung

$$R^{1}$$
— $CH_{2}$ — $R^{2}$  +  $R^{4}$ — $NH_{2}$  +  $R^{3}$ C- $(OR)_{3}$ —

 $R = CH_{3}, C_{2}H_{5}$ 

durch Kondensation hergestellt werden, wohei R1 bis R4 die ohen genannte Bedeutung haben.

Beispielsweise ergibt die Umsetzung von 2,4-Pentandion mit Anthranilsäure-2-ethylhexylester und Triethylorthoformiat die Verbindung 24 in Tabelle 2.

Die Lichtschutzmittel enthaltenden kosmetischen und pharmazeutischen Zubereitungen sind in der Regel auf der Basis eines Trägers, der mindestens eine Ölphase enthält. Es sind aber auch Zubereitungen allein auf wäßriger Basis bei Verwendung von Verbindungen mit hydrophilen Substituenten möglich. Demgemäß kommen Öle, Öl-in-Wasser- und Wasser-in-Öl-Emulsionen, Cremes und Pasten. Lippenschutzstiftmassen oder fettfreie Gele in Betracht.

Solche Sonnenschutzpräparate können demgemäß in flüssiger, pastöser oder fester Form vorliegen, beispielsweise als Wasser-in-Öl-Cremes, Öl-in-Wasser-Cremes und -Lotionen, Aerosol-Schaumeremes, Gele, Öle, Fettstifte, Puder, Sprays oder alkoholisch-wäßrige Lotionen.

Übliche Ölkomponenten in der Kosmetik sind beispielsweise Paraffinöl, Glycerylstearat, Isopropylmyristat, Diisopropyladipat, 2-Ethylhexansäurecetylstearylester, hydriertes Polyisobuten, Vaseline, Caprylsäure/Caprinsäure-Triglyceride, mikrokristallines Wachs, Lanolin und Stearinsäure.

Übliche kosmetische Hilfsstoffe, die als Zusätze in Betracht kommen können, sind z. B. Co-Emulgatoren, Fette und Wachse, Stabilisatoren, Verdickungsmittel, biogene Wirkstoffe, Filmbildner, Duftstoffe, Farbstoffe, Perlglanzmittel, Konservierungsmittel, Pigmente, Elektrolyte (z. B. Magnesiumsulfat) und pH-Regulatoren. Als Co-Emulgatoren kommen vorzugsweise bekannte W/O- und daneben auch O/W-Emulgatoren wie etwa Polyglycerinester, Sorbitanester oder teilveresterte Glyceride in Betracht. Typische Beispiele für Fette sind Glyceride; als Wachse sind u. a. Bienenwachs, Paraffinwachs oder Mikrowachse gegebenenfalls in Kombination mit hydrophilen Wachsen zu nennen. Als Stabilisatoren können Metallsalze von Fettsäuren wie z. B. Magnesium-, Aluminium- und/oder Zinkstearat eingesetzt werden. Geeig-
